Sales Price of Homes The table shows the median sales price $S$ (in thousands of dollars) of existing one-family homes in the United States from 1990 to 2013. The data can be approximated by the model
$S=\frac{0.2716 t^{2}-10.1895 t+98.2468}{-8.5474 t^{3}+0.0061 t^{2}-0.1369 t+1}, \quad 0 \leq t \leq 23$
where $t$ represents the year, with $t=0$ corresponding to 1990. (Data Source: National Association of Realtors)

|  | Year | Median sales price, $S$ |
| :---: | :---: | :---: |
|  | 1990 | 97.3 |
|  | 1991 | 102.7 |
|  | 1992 | 105.5 |
|  | 1993 | 109.1 |
|  | 1994 | 113.5 |
|  | 1995 | 117.0 |
|  | 1996 | 122.6 |
|  | 1997 | 129.0 |
|  | 1998 | 136.0 |
|  | 1999 | 141.2 |
|  | 2000 | 147.3 |
|  | 2001 | 156.6 |

|  | Year | Median sales price, $S$ |
| :---: | :---: | :---: |
|  | 2002 | 167.6 |
|  | 2003 | 180.2 |
|  | 2004 | 195.2 |
|  | 2005 | 219.0 |
|  | 2006 | 221.9 |
|  | 2007 | 217.9 |
|  | 2008 | 196.6 |
|  | 2009 | 172.5 |
|  | 2010 | 172.9 |
|  | 2011 | 166.1 |
|  | 2012 | 176.8 |
|  | 2013 | 197.1 |

(a) Use a graphing utility to create a scatter plot of the data.
(b) Use the model to approximate the median sales prices for each year from 1990 through 2013.
(c) Compare the estimated to the actual data to determine whether the model is a good fit for the data. Explain.
(d) Examine the scatter plot from part (a). Is there another type of model that fits the data? Explain your reasoning.
(e) Use the cubic regression feature of a graphing utility to find a model for the data..
(f) Use a graphing utility to plot the data and graph the given rational model and the model that you found in part (e) in the same viewing window.
(g) Use each model to predict the median sales price of an existing one-family home in 2020. Which model should be used to predict future values? Explain your reasoning.
