Tuberculosis Cases The table shows the numbers $N$ (in thousands) of tuberculosis cases in the United States from 1991 through 2016. The data can be modeled by the rational model
$N=\frac{29.4-0.32 x}{1+0.05 x}$
where $t$ represents the year, with $t=1$ corresponding to 1991. (Source: Centers for Disease Control and Prevention)

| DATA | Year | Tuberculosis cases, $N$ (in thousands) | Year | Tuberculosis cases, $N$ (in thousands) |
| :---: | :---: | :---: | :---: | :---: |
|  | 1991 | 26.283 | 2004 | 14.499 |
|  | 1992 | 26.673 | 2005 | 14.065 |
|  | 1993 | 25.102 | 2006 | 13.728 |
|  | 1994 | 24.206 | 2007 | 13.281 |
|  | 1995 | 22.726 | 2008 | 12.890 |
|  | 1996 | 21.210 | 2009 | 11.517 |
|  | 1997 | 19.751 | 2010 | 11.157 |
|  | 1998 | 18.286 | 2011 | 10.509 |
|  | 1999 | 17.499 | 2012 | 9.940 |
|  | 2000 | 16.308 | 2013 | 9.561 |
|  | 2001 | 15.945 | 2014 | 9.398 |
|  | 2002 | 15.055 | 2015 | 9.547 |
|  | 2003 | 14.835 | 2016 | 9.272 |

(a) Use a graphing utility to plot the data and graph the model in the same viewing window.
(b) Use the model to approximate the number of tuberculosis cases in the United States for each year from 1991 to 2016.
(c) Compare the estimated to the actual data. Is the model a good fit for the data? Explain.
(d) Use the regression feature of the graphing utility to find a linear model and a quadratic model for the data.
(e) Compare the linear, quadratic, and rational models by determining how well each model fits the data.
(f) Which model do you think is best to predict future numbers of tuberculosis cases? Explain your reasoning. Then use this model to predict the number of tuberculosis cases in 2025.
